

Intelligent Infrared Gesture Sensing Sensor

Introduction

Intelligent infrared gesture sensor is controlled by microprocessor (MCU). It can be programmed online to meet the application requirements and use scenarios for different customers. This product integrates infrared receiver, transmitter, MCU, signal processing unit and output control unit. It has strong anti-photoelectric interference ability, stable and reliable performance and small size.

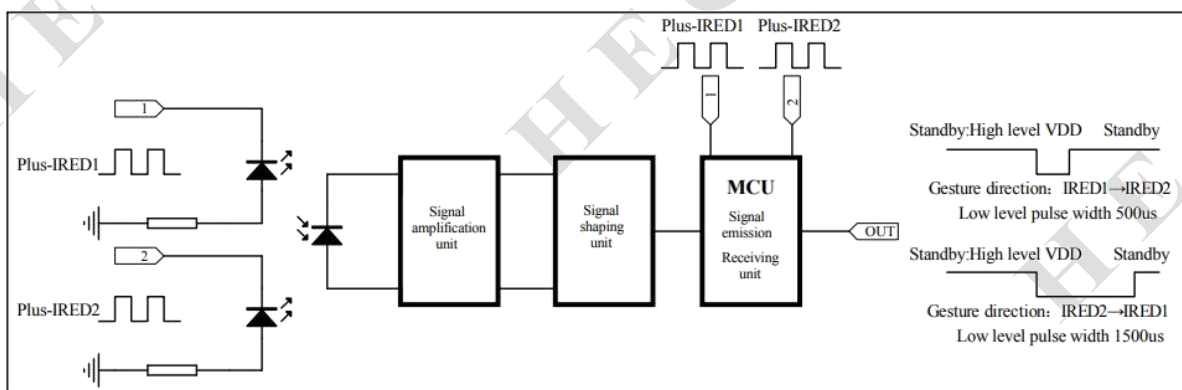

This product is suitable for various household appliances, such as multi-gesture logic function control, lighting control, display backlight control, toys, intelligent trash cans, object motion direction recognition and other consumer products and other induction control scenes.

The dimensions of this product can be customized according to customer requirements.

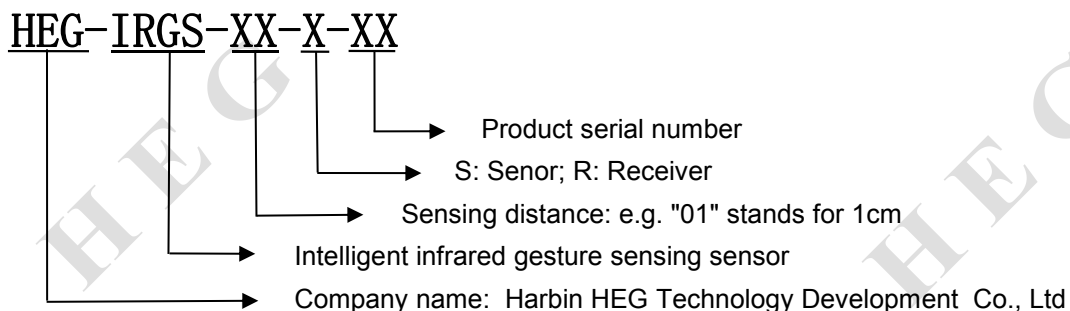

Working Principle

The infrared transmitter transmits two coded infrared signals. When a hand or an object moves in the detection area, the reflected two infrared signals are received and processed by the receiving module. After judging the time sequence of the reflected two signals, the MCU identifies gestures and the moving direction of the moving object, and then outputs low-level signals with different pulse widths to realize a variety of logic output control signals. The signal line is connected with the MCU IO port or other control interfaces of the customer product. By detecting the low-level pulse width of the signal line, peripherals are realized.

Functional Block Diagram

Model Naming Rules

Product Features

- 1、Volume: 37mm×14mm×10mm;
- 2、Sensing distance: 2-20cm,High sensitivity; See test method for details;
- 3、Light immunity: strong immunity to ambient light.

Main Technical Parameters of Products

Main Parameter	Numerical Value	Unit	Remarks
Operating Voltage (DC)	3.0-5.5	V	Recommend:VDD=3.3V-5.0V
Signal Output Mode	Low level pulse signal	/	On standby: when pin signal is triggered by high level VDD; when IRED1→IRED2, it is input Output 500us low-level pulse signal; Output when IRED2→IRED 1500us low level pulse signal; (customizable)
Output Drive Current	≤10.0	mA	Test condition:VDD=3.3V
Outline Dimension	L*W*H 37*14*10	mm	Customizable
Port	4P*1	mm	4P Horizontal SMT socket

Inductive Distance	d=2-20	cm	Test condition:VDD=3.3V; See below for test methods; When transparent glass or infrared transparent panel is set in front of the sensor, the distance between the sample and the panel \leq 1mm; (customizable)
Gesture Swing Amplitude	\geq 20	cm	Test conditions: at the induction distance of 20cm

Test Method

HEG-IRGS-XX-R-02

Instructions for Product Use

The interface socket of this module contains four pins: "A", "B", "-" and "+".

A: Suspended

B: Trigger signal output terminal. Trigger: when the infrared signal is blocked from IRED1→IRED2, a 500us low-level pulse signal is output; When the infrared signal is blocked by IRED2→IRED1, a 1500us low-level pulse signal is output. By detecting the low-level width of the signal line, the direction of gesture and object movement can be identified, and peripheral control or other applications can be realized. (signal output mode can be customized)

-: Negative pole of DC power supply;

+: The DC power supply is connected to the positive pole, with 3.0-5.5V;

Note: Do not connect the positive pole and negative pole upside down to avoid burning the sensor.
